## Question 1

Flag question

Correct Mark 1.00 out of 1.00

Why is response length a poor proxy for output quality?

a. Length varies by model version, making comparisons invalid
b. Length is difficult to measure reliably at scale
c. Short responses are always preferred by users
d. A verbose wrong answer scores higher than a concise correct one under length-based assessment ✓

The correct answer is: A verbose wrong answer scores higher than a concise correct one under length-based assessment

## Question 2

Flag question

Correct Mark 1.00 out of 1.00

An output evaluation shows 92% accuracy overall but only 55% on one subcategory representing 6% of volume. What should be assessed?

a. Whether the model tier needs upgrading for the subcategory
b. Whether 92% overall meets the industry benchmark for AI accuracy
c. Whether the 55% subcategory contains inputs where a wrong answer carries significant consequences ✓
d. Whether the subcategory should be excluded to raise the headline metric

The correct answer is: Whether the 55% subcategory contains inputs where a wrong answer carries significant consequences

## Question 3

Flag question

Correct Mark 1.00 out of 1.00

After six months of stable performance, a 3% quality decline appears over four weeks. The team dismisses it as variance. What risk does this create?

a. The quality decline will reverse naturally in the next four-week cycle
b. A genuine regression may compound into a significant issue before it is investigated
c. The API costs will increase as quality declines
d. The automated monitoring tool may flag false positives in subsequent cycles

The correct answer is: A genuine regression may compound into a significant issue before it is investigated

## Question 4

Flag question

Incorrect Mark 0.00 out of 1.00

A deployment's evaluation shows strong average quality but users escalate frequently. What evaluation dimension is most likely missing?

a. Emotional acknowledgement and empathy in responses
b. Response accuracy on the most common query types
c. Format compliance with the output specification
d. Response latency relative to user expectations

The correct answer is: Emotional acknowledgement and empathy in responses

## Question 5

Flag question

Correct Mark 1.00 out of 1.00

A six-month-old deployment begins producing increasingly generic answers with no code or prompt changes. What should be investigated first?

a. Whether streaming mode was accidentally disabled
b. Whether the API authentication expired
c. Whether the context window limit was reduced by the provider
d. Whether the retrieval knowledge base has become stale or stopped being updated

The correct answer is: Whether the retrieval knowledge base has become stale or stopped being updated

## Question 6

Flag question

Correct Mark 1.00 out of 1.00

An evaluation programme consistently measures quality but the deployment has not improved in six months. What is the defining problem?

a. Evaluation findings are not being translated into system changes — the feedback loop from measurement to action is broken ✓
b. The evaluation frequency is too low to detect quality opportunities
c. The evaluation dataset needs refreshing with recent production samples
d. The model tier has reached its capability ceiling for this use case

The correct answer is: Evaluation findings are not being translated into system changes — the feedback loop from measurement to action is broken

## Question 7

Flag question

Correct Mark 1.00 out of 1.00

A practitioner wants to confirm that a prompt change genuinely improved quality. The most reliable approach is:

a. Reading several new outputs and judging them as improved
b. Asking the team whether the new prompt feels better
c. Monitoring user satisfaction for two weeks after the change
d. Running both prompt versions on the same fixed evaluation set and measuring the quality difference ✓

The correct answer is: Running both prompt versions on the same fixed evaluation set and measuring the quality difference

## Question 8

Flag question

Correct Mark 1.00 out of 1.00

An evaluator rates an output as passing. A separate evaluator rates the same output as failing. Both applied the same rubric. The most productive next step is:

a. Deferring to the more senior evaluator
b. Removing the output from the dataset as too contested
c. Investigating which specific criterion caused disagreement to clarify the rubric ✓
d. Averaging the two scores and proceeding

The correct answer is: Investigating which specific criterion caused disagreement to clarify the rubric

## Question 9

Flag question

Correct Mark 1.00 out of 1.00

What single characteristic most distinguishes a mature evaluation programme from an immature one?

a. The sophistication of automated tooling used to run evaluations
b. The number of evaluation dimensions assessed per output
c. Findings consistently translate into targeted system changes that produce measurable quality improvement over time
d. The volume and diversity of the evaluation dataset maintained

The correct answer is: Findings consistently translate into targeted system changes that produce measurable quality improvement over time

## Question 10

Flag question

Correct Mark 1.00 out of 1.00

A hiring tool evaluation must test for demographic bias. Which method directly measures this?

a. Running general accuracy evaluation on a representative test set
b. Measuring response latency across different user groups
c. Checking the system prompt for explicit demographic references
d. Submitting identical candidate profiles with names associated with different demographic groups and measuring scoring consistency

The correct answer is: Submitting identical candidate profiles with names associated with different demographic groups and measuring scoring consistency

## Question 11

Flag question

Incorrect Mark 0.00 out of 1.00

An output correctly formats the response but the user's underlying problem remains unsolved. Which evaluation dimension failed?

a. Factual accuracy
b. Response length
c. Format compliance
d. Helpfulness

The correct answer is: Helpfulness

# Question 12

Flag question

Correct Mark 1.00 out of 1.00

A practitioner confirms quality is strong through evaluation but never acts on the findings. What does this indicate about the evaluation programme?

a. The programme is functioning correctly — strong performance requires no action
b. Strong results confirm the system can be scaled without further review
c. The evaluation frequency should be reduced since performance is satisfactory
d. The programme is measuring without completing the improvement feedback loop ✓

The correct answer is: The programme is measuring without completing the improvement feedback loop

# Question 13

Flag question

Correct Mark 1.00 out of 1.00

What is the most important output of the evaluation process beyond a quality score?

a. A compliance certificate confirming evaluation was completed
b. A specific failure pattern diagnosis identifying which inputs fail, how they fail, and why ✓
c. A ranked list of best-performing outputs for use as examples
d. The API cost per evaluation run

The correct answer is: A specific failure pattern diagnosis identifying which inputs fail, how they fail, and why

# Question 14

Flag question

Correct Mark 1.00 out of 1.00

A domain expert finds a critical error in an output that passed all automated checks. What does this most directly reveal?

a. Automated tools cannot detect domain- specific errors that require expertise ✓
b. The automated checks were misconfigured
c. The error was introduced after the checks ran
d. The evaluation threshold was too lenient

The correct answer is: Automated tools cannot detect domain- specific errors that require expertise

## Question 15

Flag question

Correct Mark 1.00 out of 1.00

An evaluator finds an output that looks correct but they lack the domain expertise to confirm it. What is the appropriate action?

a. Flag it as requiring domain expert review before the rating is recorded
b. Ask Claude to confirm whether the output is correct
c. Rate it as passing since it passed the visual inspection
d. Rate it as failing by default when uncertain

The correct answer is: Flag it as requiring domain expert review before the rating is recorded

## Question 16

Flag question

Correct Mark 1.00 out of 1.00

A new regulation requires AI hiring tools to be tested for demographic bias before deployment. The team has not run this test. The correct response is:

a. Deploy and run bias testing in parallel during the first month of operation
b. Add a disclaimer that the tool has not been bias-tested
c. Delay deployment until bias testing is completed and findings are addressed
d. Submit the tool to Anthropic for bias certification

The correct answer is: Delay deployment until bias testing is completed and findings are addressed

## Question 17

Flag question

Correct Mark 1.00 out of 1.00

What does "inter-rater reliability" measure?

a. Agreement between independent evaluators rating the same output
b. The cost per evaluation completed by different reviewers
c. The average score across multiple sessions
d. The speed at which evaluators complete their ratings

The correct answer is: Agreement between independent evaluators rating the same output

## Question 18

Flag question

Correct Mark 1.00 out of 1.00

A practitioner adds five new examples to address a specific failure category. Before deploying the change, they should:

a. Run regression evaluation across all categories on a fixed test set to confirm no previously passing cases now fail
b. Test on several new examples to check the change looks reasonable
c. Ask Claude to review the new examples for internal consistency
d. Run the change on a new dataset of previously unseen examples

The correct answer is: Run regression evaluation across all categories on a fixed test set to confirm no previously passing cases now fail

## Question 19

Flag question

Correct Mark 1.00 out of 1.00

A deployment used for internal knowledge management starts returning incorrect answers about recently changed processes. The most direct cause is:

a. The knowledge base has not been updated to reflect the process changes
b. The system prompt temperature drifted upward over time
c. Users are submitting more complex queries than at launch
d. The model version was deprecated silently

The correct answer is: The knowledge base has not been updated to reflect the process changes

## Question 20

Flag question

Correct Mark 1.00 out of 1.00

Which characteristic best identifies a potential hallucination in a Claude output?

a. A specific named source or statistic that cannot be verified anywhere
b. The response uses hedging language
c. The response is shorter than expected
d. The response references an earlier turn

The correct answer is: A specific named source or statistic that cannot be verified anywhere
