Question #21 (Topic: Exam A) *Topic 1*

You are compiling factors that should drive the choice between Model Context Protocol (MCP), direct API integration, and agent-to-agent handoff.
Which two factors belong on the list? (Choose two.)
Each correct answer presents a complete solution.

A. whether the underlying transport supports encryption in transit between the integrated services

B. whether the interaction is stateless and latency-sensitive or stateful and longer-running

C. whether the vendor publishes detailed reference documentation for each candidate protocol

D. whether the team has prior implementation experience with any of the candidate protocols

E. whether the integration must be portable across multiple AI clients in the ecosystem

Correct Answer: BE

Question #22 (Topic: Exam A) *Topic 1*

You are selecting a protocol for a single low-latency stateless tool call from a Claude-based assistant to an internal pricing service that already exposes a stable HTTP API.
Which integration mechanism is the most appropriate?

A. a bespoke streaming protocol layered over an unrelated asynchronous message bus

B. an agent-to-agent handoff that introduces another Claude-based agent in front of the pricing service

C. a long-lived stateful session protocol for a stateless single-call interaction

D. a direct API call to the existing endpoint with the appropriate scoped credentials

Correct Answer: D

Question #23 (Topic: Exam A) *Topic 1*

You are assessing a Claude-based system whose dominant risk is silent quality drift on safety relevant outputs after a model-version upgrade.
Which assessment activity most directly addresses this risk?

A. Disable adversarial evaluation entirely during model-version upgrade cycles to reduce evaluation cost, accepting that safety drift will go undetected until it appears in production.

B. Skip evaluation on each model-version upgrade and rely on user-submitted complaints to surface safety drift after the upgraded model has already served production traffic.

C. Rotate adversarial inputs randomly so no two upgrades are scored on the same set.

D. Maintain an adversarial evaluation set with version-attributed scoring so each upgrade is measured against the same set before promotion.

Correct Answer: D

Question #24 (Topic: Exam A) *Topic 1*

You are designing a human-in-the-loop validation workflow.
Which two design elements belong in the workflow? (Choose two.)
Each correct answer presents a complete solution.

A. capture of reviewer decisions as labeled data that feeds the evaluation set over time

B. mandatory reviewer agreement with the model output to maintain consistent reviewer-model alignment

C. aggregate reviewer throughput metrics published weekly to leadership for headcount planning

D. uniform sampling of all model outputs to give every request an equal chance of review

E. risk-stratified sampling that concentrates reviewer attention on low-confidence and high-impact outputs

Correct Answer: AE

Question #25 (Topic: Exam A) *Topic 1*

You are designing a test strategy for a Claude-based pipeline that handles sensitive financial data.
Which two test types should be prioritized to cover both safety-under-attack and cross-component correctness? (Choose two.)

A. integration tests that verify end-to-end pipeline behavior across all components

B. unit tests targeting individual prompt-template rendering logic only

C. adversarial tests using prompt-injection and malformed-input cases

D. smoke tests to verify core paths after each deployment

E. regression tests against a stable reference set of previously known good outputs

Correct Answer: AC

Question #26 (Topic: Exam A) *Topic 1*

A Claude-based research assistant begins producing responses that confidently contradict its retrieved source documents despite no change to the retrieval pipeline.
Which two diagnostic actions most directly identify the root cause of this behavior? (Choose two.)

A. Switch the retrieval index to a denser embedding model to improve chunk relevance scores.

B. Isolate whether the failure reproduces on the previous model version to test for model mismatch.

C. Inspect system-prompt grounding instructions to determine whether citation constraints remain intact.

D. Reduce the temperature setting to lower response variance across all query types.

E. Increase the context window size to allow more retrieved chunks per query.

Correct Answer: BC

Question #27 (Topic: Exam A) *Topic 1*

A pilot AI assistant for procurement specialists shows 89 percent first-response acceptance, but follow-up surveys reveal that specialists frequently override the assistant's vendor recommendations after consulting unrelated criteria the assistant did not consider. The pilot owner wants to ship the assistant as is, given the strong acceptance rate.
Which two discernment-competency observations should you raise BEFORE approving the launch? (Choose two.)
Each correct answer presents part of the solution.

A. Acceptance does not measure whether recommendations are right after specialist review.

B. The survey response rate may not be statistically representative of all the specialists.

C. The unconsidered criteria represent a scope gap in the assistant's input space directly.

D. The acceptance rate alone is sufficient evidence of readiness for general production use.

E. The pilot duration was likely too short to establish reliability across the full year.

Correct Answer: AC

Question #28 (Topic: Exam A) *Topic 1*

The platform team at Trenova Systems, Inc. needs to reduce per-query cost and p95 latency for a high-volume Claude pipeline without degrading output quality on the core use case.
Which two optimizations directly target both cost and latency simultaneously? (Choose two.)

A. Add a retrieval step that fetches the full source corpus into the context window before generation.

B. Expand the system prompt to include additional few-shot examples for every request.

C. Increase max_tokens to reduce the frequency of truncated responses requiring follow-up calls.

D. Enable prompt caching on the static system-prompt prefix to reduce billable input tokens on repeated calls.

E. Route straightforward query types to a smaller, faster Claude model and reserve the full model for complex cases.

Correct Answer: DE

Question #29 (Topic: Exam A) *Topic 1*

After a prompt template update, several previously passing test cases now produce unexpected outputs.
Which test type is specifically designed to detect this category of failure?

A. regression tests scored against a stable reference set of known-good behavior

B. adversarial tests that probe for prompt-injection vulnerabilities

C. integration tests that validate cross-component pipeline behavior

D. smoke tests that confirm high-level system availability after the change

Correct Answer: A

Question #30 (Topic: Exam A) *Topic 1*

You are integrating human review into a high-volume classification pipeline where reviewing every output is infeasible.
Which sampling strategy best balances throughput with quality oversight?

A. no sampling at all, relying entirely on user-submitted complaints to surface quality and safety issues after they have already affected end users at scale

B. risk-stratified sampling that reviews all low-confidence and high-impact outputs and a smaller random sample of high-confidence routine outputs

C. inverse sampling that reviews only high-confidence routine outputs and skips all low-confidence and high-impact outputs

D. universal sampling that reviews every output regardless of confidence level or throughput impact, treating all outputs as equally requiring human review

Correct Answer: B
